# **Executive Summary**

#### Summary of methodologies

- Data Collection through API
- Data Collection with Web Scraping
- Data Wrangling
- Exploratory Data Analysis with SQL
- Exploratory Data Analysis with Data Visualization
- Interactive Visual Analytics with Folium
- Machine Learning Prediction

#### Summary of all results

- Exploratory Data Analysis result
- Interactive analytics in screenshots
- Predictive Analytics result

#### Introduction

Project background and context

SpaceX has achieved massive savings in the space industry. Using its Falcon 9 Rocket launches. SpaceX advertises a cost of just 62 million dollars compared to the typical 165 million dollars cost. Much of the savings was achieved via the re use of the captured stage one rockets. SpaceY is a new company that wants to bid against SpaceX for the rocket launching business. SpaceY has contracted us to study the data available to determine if SpaceY can compete with SpaceX. We will use different analytics techniques and create a machine learning pipeline to predict if the first stage will land successfully, in order to estimate the cost of launches.

- Problems you want to find answers
  - Factors that affects successful launch
  - Inter-dependency of factors that affect successful launch
  - What conditions that SpaceY has to achieve so that it can have highest success probability of launches.

# Methodology

#### **Executive Summary**

- Data collection methodology:
  - SpaceX Rest API
  - Web Scrapping from Wikipedia
- Perform data wrangling
  - One-Hot encoding to prepare data for Machine Learning
  - Dropping of Irrelevant data
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - How to build, tune, evaluate classification models

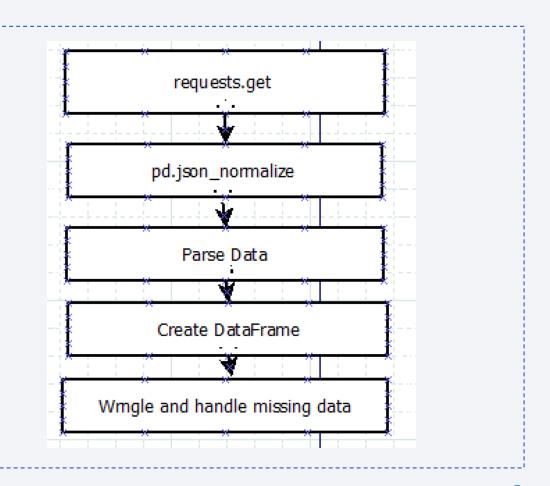

#### **Data Collection**

- Data Collected from using get request to the SpaceX API
- Collected data was turned to DataFrame using json\_normalize()
- Data cleaning and fill missing data when aproperiate
- Collected more data using web scrapping from Wikipedia for Falcon 9 Launch records
- Used BeautifuSoup data was parsed HTML tables.
- Converted HTML table data into Pandas DataFrame

# Data Collection – SpaceX API

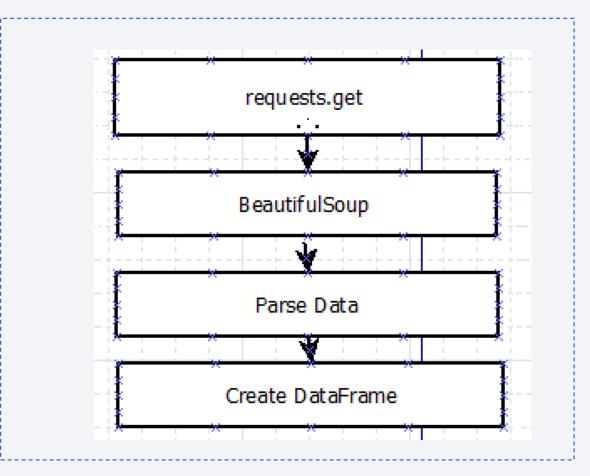

- Steps to data collection
  - Use requests.get to access information on API
  - Use pd.json\_normalize to turn json data into dataframe
  - Parse internal data using helper methods such as getBoosterVersion, getLaunchSite, ...
  - Create new launch\_dict dataframe of looked up date
  - Handle missing data
- Notebook on GitHub

IBM-Data-Science-Professional-Certificate/jupyter-labsspacex-data-collection-api.ipynb at main · seang1968/IBM-Data-Science-Professional-Certificate (github.com)

### **Data Collection - Scraping**

- Steps for Web Scrapping
  - requests.get to get webpage data
  - Use BeautifulSoup to parse HTML data
  - Parse data from HTML Tables for Launch information
  - Convert launch\_dict into a DataFrame
- Notebook on GitHub
- <u>IBM-Data-Science-Professional-Certificate/jupyter-labs-webscraping.ipynbat main · seang1968/IBM-Data-Science-Professional-Certificate (github.com)</u>

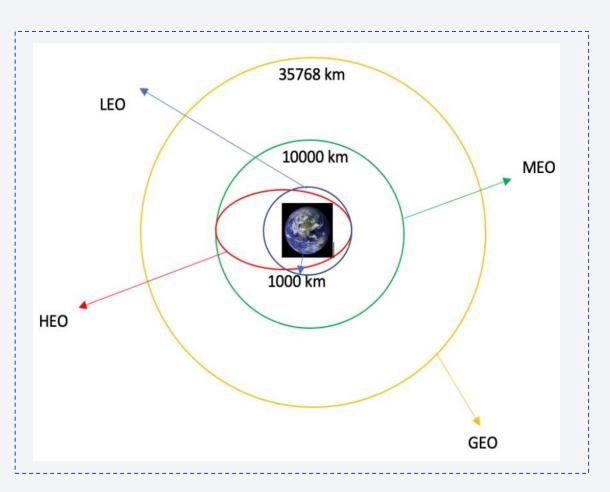

# **Data Wrangling**

- Describe how data were processed
  - Calculate the number of launches on each site
  - Calculate the number and occurrence of each orbit
  - Calculate the number and occurrence of mission outcome per orbit type
  - Create a landing outcome label from Outcome column
  - Calculate the percentage of success

#### Notebook on GitHub

IBM-Data-Science-Professional-Certificate/labs-jupyter-spacex-Data wrangling.ipynb at main · seang1968/IBM-Data-Science-Professional-Certificate (github.com)

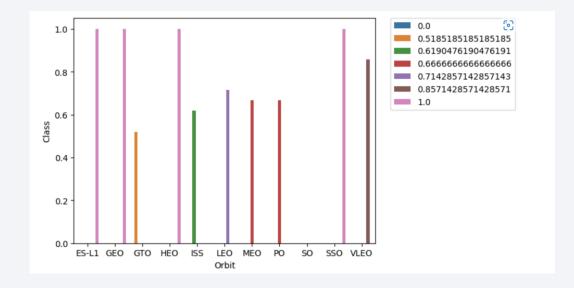

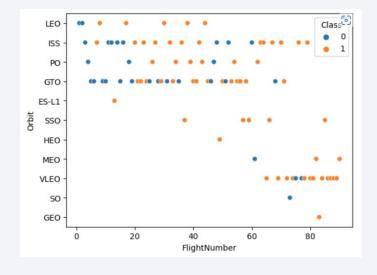

#### **EDA** with Data Visualization

 We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend.

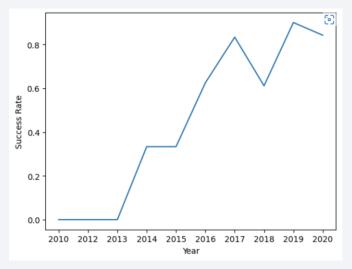

#### Notebook on GitHub

<u>IBM-Data-Science-Professional-Certificate/jupyter-labs-eda-dataviz.ipynb at main · seang1968/IBM-Data-Science-Professional-Certificate (github.com)</u>

#### **EDA** with SQL

- We loaded the SpaceX dataset into a sqlite3 database without leaving the jupyter notebook.
- We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
  - The names of unique launch sites in the space mission.
  - The total payload mass carried by boosters launched by NASA (CRS)
  - The average payload mass carried by booster version F9 v1.1
  - The total number of successful and failure mission outcomes
  - The failed landing outcomes in drone ship, their booster version and launch site names.

#### Notebook on GitHub

• IBM-Data-Science-Professional-Certificate/jupyter-labs-eda-sql-coursera\_sqllite.ipynb at main · seang1968/IBM-Data-Science-Professional-Certificate (github.com)

### Build an Interactive Map with Folium

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
  - Are launch sites near railways, highways and coastlines.
  - Do launch sites keep certain distance away from cities.

#### Notebook on GitHub

IBM-Data-Science-Professional-Certificate/Interactive Visual Analytics with Folium.ipynb at main · seang1968/IBM-Data-Science-Professional-Certificate (github.com)

### Build a Dashboard with Plotly Dash

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

IBM-Data-Science-Professional-Certificate/app.py at main · seang1968/IBM-Data-Science-Professional-Certificate (github.com)

# Predictive Analysis (Classification)

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.
- Notebook on GitHub

IBM-Data-Science-Professional-Certificate/SpaceX Machine Learning Prediction Part 5.ipynb at main · seang1968/IBM-Data-Science-Professional-Certificate (github.com)

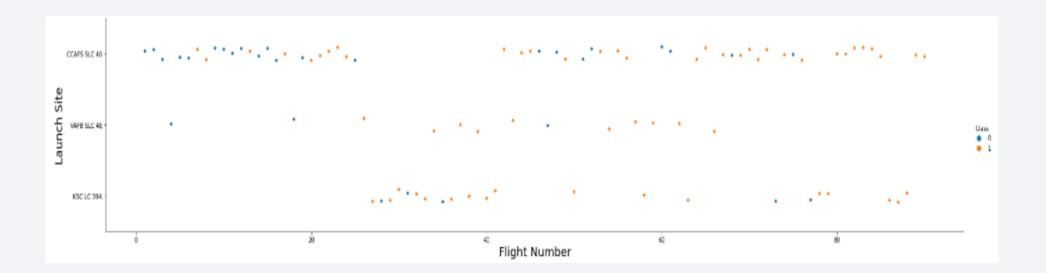

#### Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

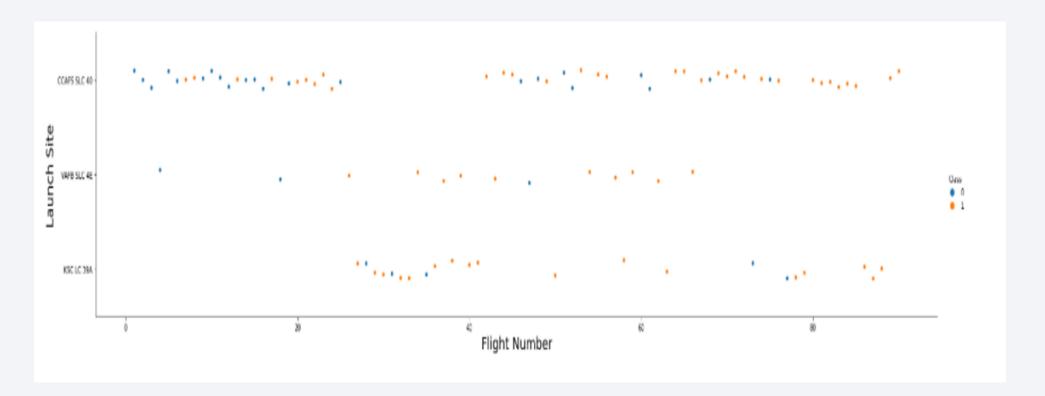

### Flight Number vs. Launch Site

• From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

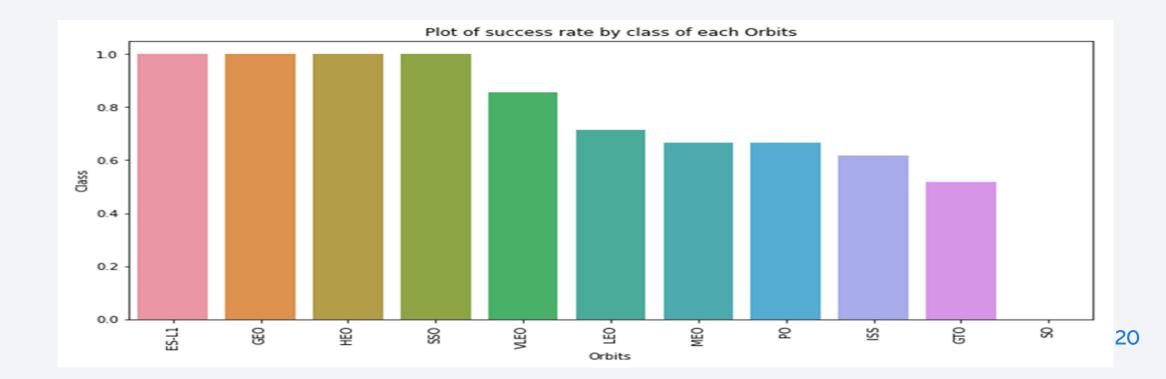

### Payload vs. Launch Site

The greater the payload mass for launch site CCAFS SLC 40, the Higher the success rate for the rocket.

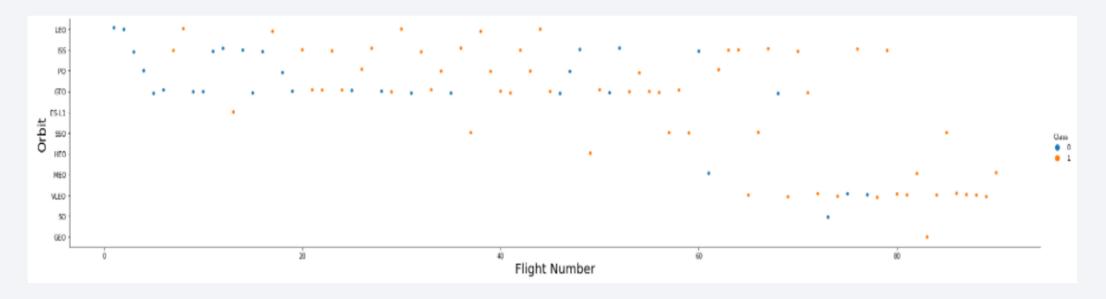

# Success Rate vs. Orbit Type

• From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

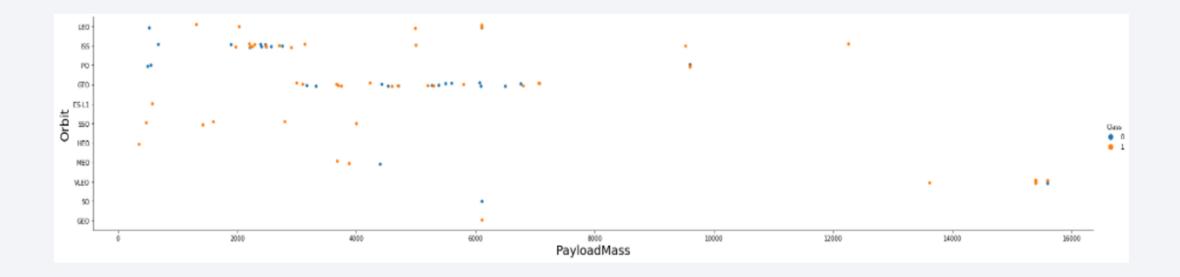

### Flight Number vs. Orbit Type

• The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

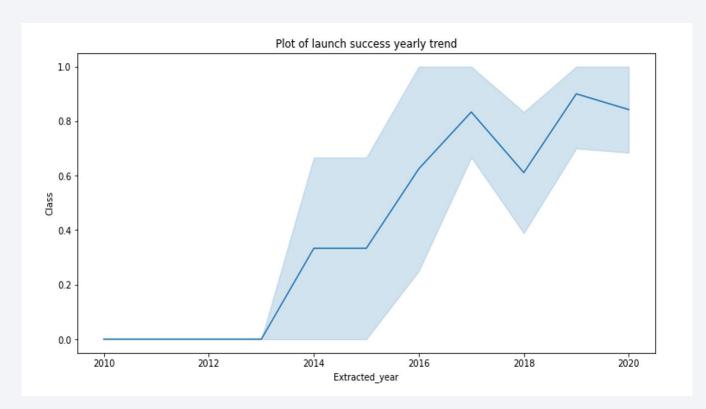

# Payload vs. Orbit Type

• We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

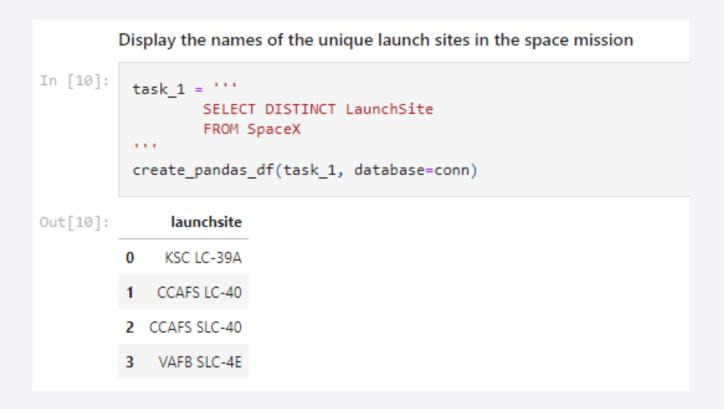

# Launch Success Yearly Trend

• From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

#### All Launch Site Names

• We used the key word **DISTINCT** to show only unique launch sites from the SpaceX data.

# Launch Site Names Begin with 'CCA'

```
Display 5 records where launch sites begin with the string 'CCA'
In [11]:
            task_2 = '''
                     SELECT *
                     FROM SpaceX
                     WHERE LaunchSite LIKE 'CCA%'
            create pandas df(task 2, database=conn)
Out[11]:
                                                                                                 payload payloadmasskg
                                                     launchsite
                                                                                                                                            customer missionoutcome
                                                                                                                                                                       landingoutcome
                             time boosterversion
                                                                                                                              orbit

                                                                                                                        0
                                                                                                                                                              Success
                                                           40
                                                                                                                               (ISS)
                                                                                                                                                                             (parachute)
                                                     CCAFS LC-
                                                                                                                               LEO
                                     F9 v1.0 B0005
                                                                                     Dragon demo flight C2
                                                                                                                                         NASA (COTS)
                                                                                                                      525
                                                                                                                                                              Success
                                                                                                                                                                             No attempt
                                                                                                                               (ISS)
                                                     CCAFS LC-
                         00:35:00
                                     F9 v1.0 B0006
                                                                                                                      500
                                                                                                                                          NASA (CRS)
                                                                                             SpaceX CRS-1
                                                                                                                                                              Success
                                                                                                                                                                             No attempt
                                                                                                                               (ISS)
                                                     CCAFS LC-
                                                                                                                               LEO
                                     F9 v1.0 B0007
                                                                                                                      677
                                                                                                                                          NASA (CRS)
                                                                                             SpaceX CRS-2
                                                                                                                                                              Success
                                                                                                                                                                             No attempt
                                                                                                                               (ISS)
```

# **Total Payload Mass**

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Display the total payload mass carried by boosters launched by NASA (CRS)

In [12]:

task_3 = '''

SELECT SUM(PayloadMassKG) AS Total_PayloadMass
FROM SpaceX
WHERE Customer LIKE 'NASA (CRS)'

"""

create_pandas_df(task_3, database=conn)

Out[12]:

total_payloadmass

45596
```

# Average Payload Mass by F9 v1.1

 We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

```
Display average payload mass carried by booster version F9 v1.1

In [13]:

task_4 = '''

SELECT AVG(PayloadMassKG) AS Avg_PayloadMass
FROM SpaceX
WHERE BoosterVersion = 'F9 v1.1'

'''

create_pandas_df(task_4, database=conn)

Out[13]:

avg_payloadmass

0 2928.4
```

# First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was 22<sup>nd</sup> December 2015

#### Successful Drone Ship Landing with Payload between 4000 and 6000

 We used the WHERE clause to filter for boosters which have successfully landed on drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but

less than 6000

#### Total Number of Successful and Failure Mission Outcomes

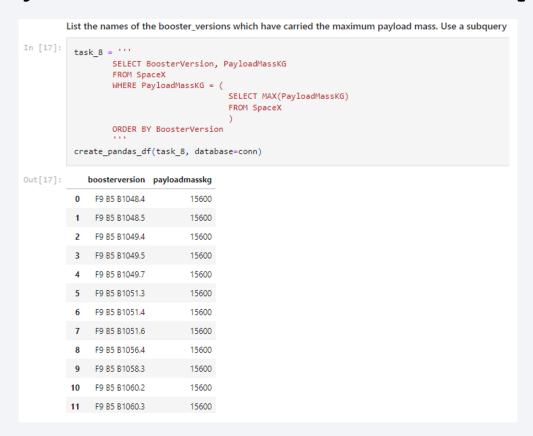

• We used wildcard like '%' to filter for WHERE MissionOutcome was a

success or a failure.

```
List the total number of successful and failure mission outcomes
In [16]:
          task 7a = '''
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task 7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create pandas df(task 7a, database=conn))
          print('The total number of failed mission outcome is:')
          create pandas df(task 7b, database=conn)
         The total number of successful mission outcome is:
            successoutcome
                      100
         The total number of failed mission outcome is:
Out[16]:
           failureoutcome
```

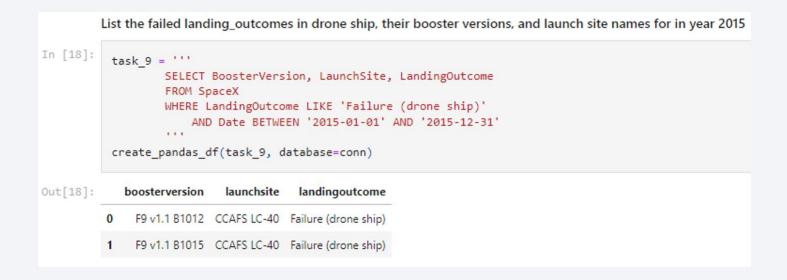

# **Boosters Carried Maximum Payload**

• We determined the booster that have carried the maximum payload using a subquery in the WHERE clause and the MAX() function.

#### 2015 Launch Records

 We used a combinations of the WHERE clause, LIKE, AND, and BETWEEN conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

#### Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

 Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order

 resent yur query result with a short explanation here

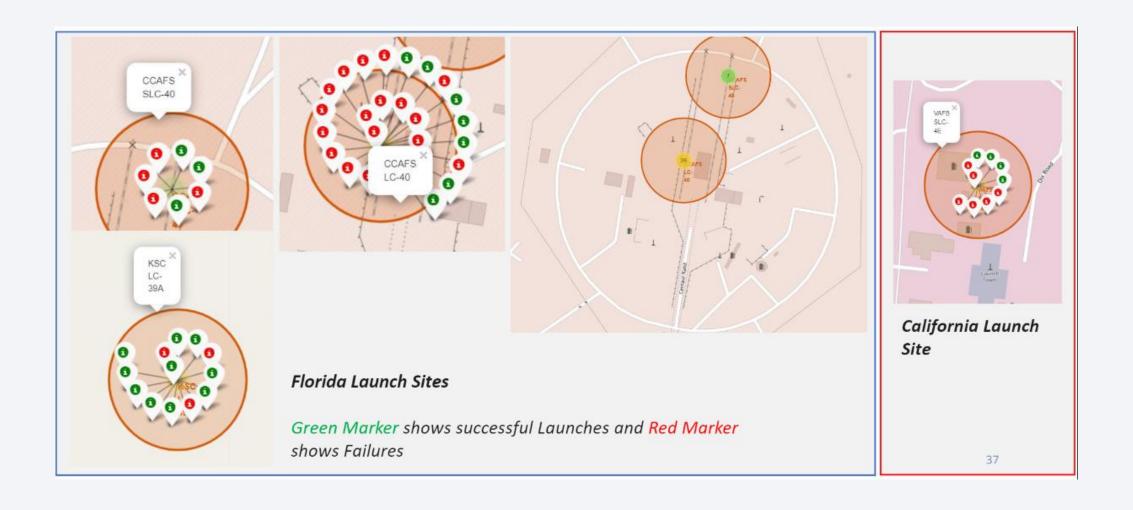

```
Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))
In [19]:
           task 10 = '''
                    SELECT LandingOutcome, COUNT(LandingOutcome)
                    FROM SpaceX
                    WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'
                    GROUP BY LandingOutcome
                    ORDER BY COUNT(LandingOutcome) DESC
           create pandas df(task 10, database=conn)
                 landingoutcome count
Out[19]:
                       No attempt
                                     10
               Success (drone ship)
                                      6
                Failure (drone ship)
                                      5
              Success (ground pad)
                                      5
                 Controlled (ocean)
                                      3
              Uncontrolled (ocean)
           6 Precluded (drone ship)
                 Failure (parachute)
```

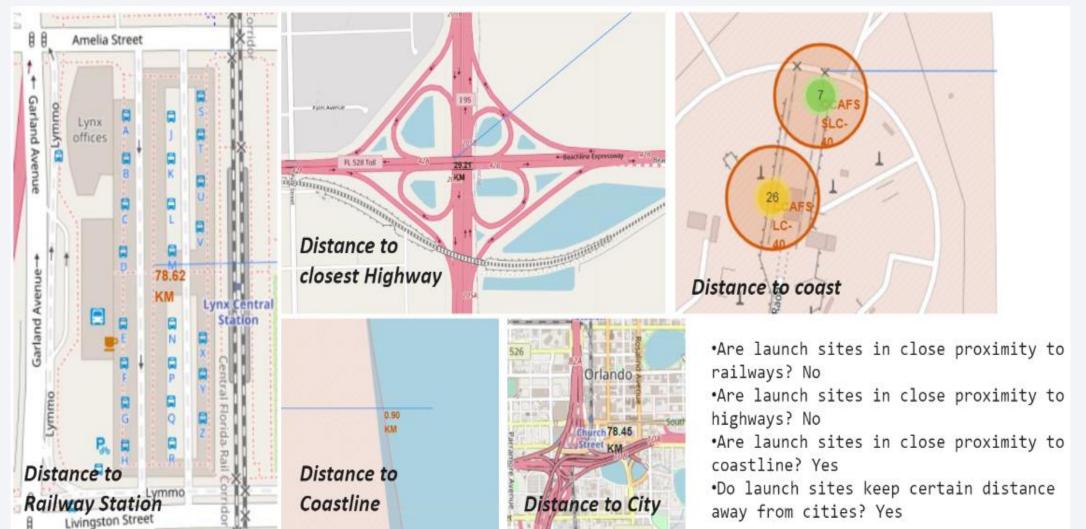

# All launch sites global map markers

# Markers showing launch sites with color labels

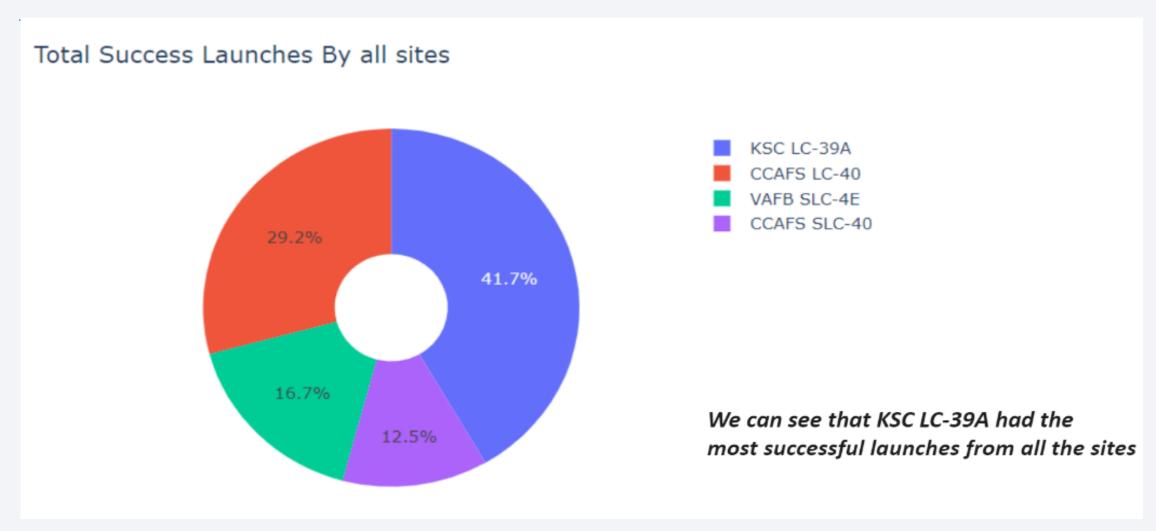

#### Launch Site distance to landmarks

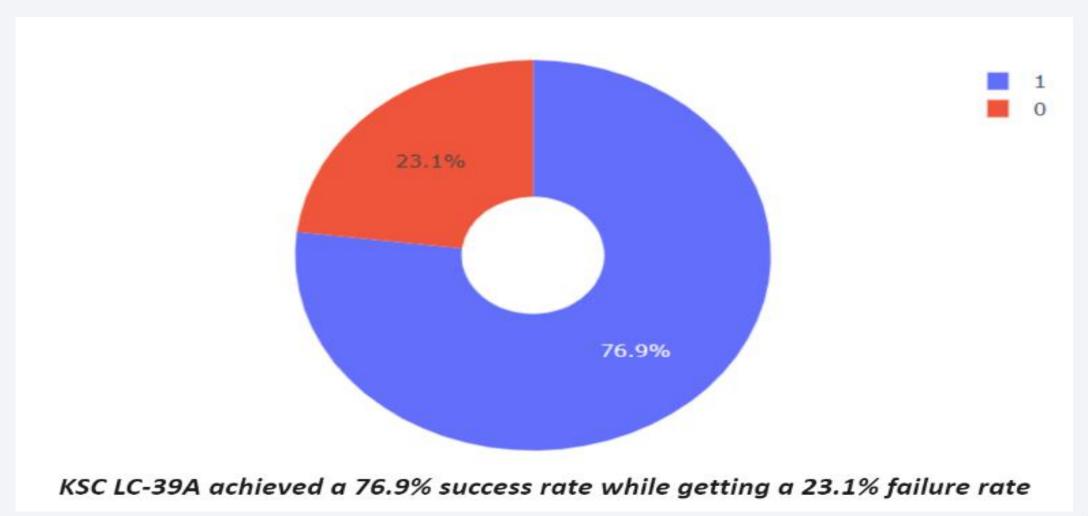

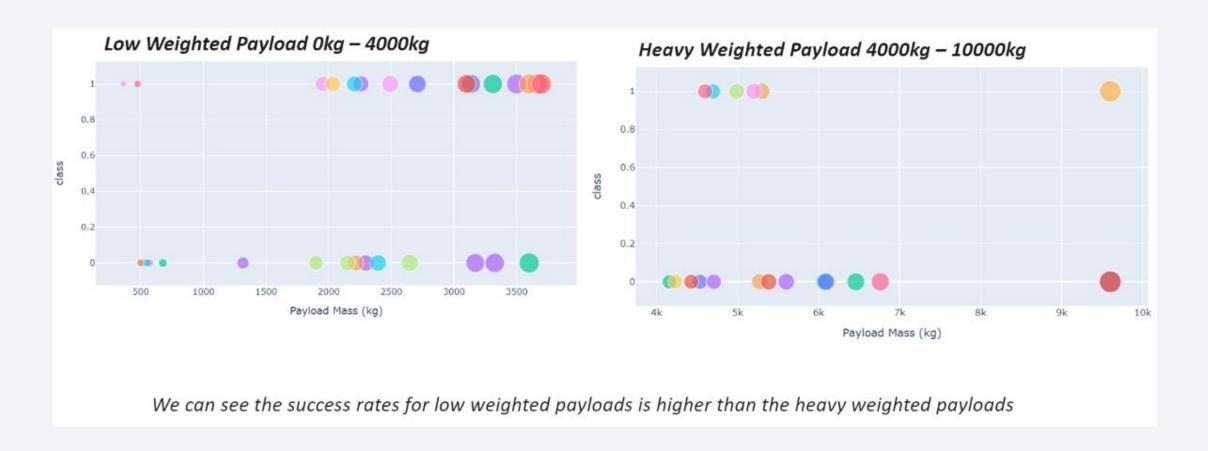

#### Pie chart showing the success percentage achieved by each launch site

#### Pie chart showing the Launch site with the highest launch success ratio

### Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

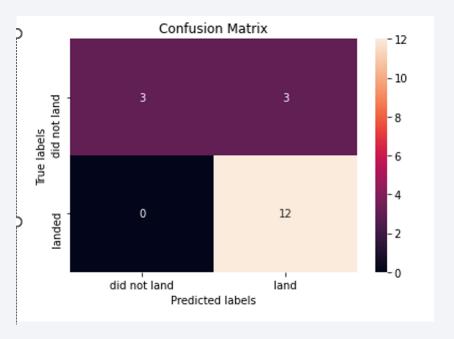

# Classification Accuracy

• The decision tree classifier is the model with the highest classification accuracy

```
models = {'KNeighbors':knn cv.best score ,
               'DecisionTree': tree cv.best score ,
               'LogisticRegression':logreg cv.best score ,
               'SupportVector': svm cv.best score }
bestalgorithm = max(models, key=models.get)
 print('Best model is', bestalgorithm,'with a score of', models[bestalgorithm])
if bestalgorithm == 'DecisionTree':
    print('Best params is :', tree cv.best params )
if bestalgorithm == 'KNeighbors':
    print('Best params is :', knn cv.best params )
if bestalgorithm == 'LogisticRegression':
    print('Best params is :', logreg cv.best params )
if bestalgorithm == 'SupportVector':
    print('Best params is :', svm cv.best params )
Best model is DecisionTree with a score of 0.8732142857142856
Best params is : {'criterion': 'gini', 'max depth': 6, 'max features': 'auto', 'min samples leaf': 2, 'min samples split': 5, 'splitter': 'random'}
```

#### **Confusion Matrix**

• The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

#### **Conclusions**

#### We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.
